Safety Footwear Classifications Basic Overview:

Protective Footwear come in many forms, offering various features and levels of protection. Below is a list of abbreviations that you will find in our range:

What does this mean?

SB (Safety Basic)

The basic standard for safety footwear. These have steel toe protection against a 200-joule impact. They may also have additional safety features which will be shown via other symbols.

For example, if you see **SBP** this means that the safety footwear also has the additional feature of **Penetration Resistance** of the **Midsole**.

S1

Whilst including the basic protection found in the SB classification, S1 also ensures the footwear has antistatic protection, is resistant to fuel oil and has energy absorption in the heel. Again other symbols can be added, such as S1-P as above.

S2

S2 offers all the same protection as S1, but also includes the added protection of preventing water penetration and absorption of the upper.

S3

S3 safety footwear also offers all the same levels of protection as S2, plus a midsole for penetration resistance.

Slip Resistance Standards:

In many workplaces, slip resistant footwear is required. Below are the separate standards of slip resistance:

We understand that our service and supply impacts your business. Our service pledge means that as suppliers we can play an integral role in the growth and success of your business - this responsibility is our priority.
